

Olist B2B Revenue Funnel

Satya Ranjan Nayak | Data Analytics Portfolio

Source snapshot analysis. Values use original historical dataset periods.

Problem

Which acquisition channels and sales activities bring sellers who generate downstream marketplace merchandise value?

Method

Preserve raw snapshots, validate source keys and foreign keys, create grain-safe analytical tables, execute SQLite analyses, reconcile totals, and review descriptive Python statistics. Excel supports comparison and prioritization; the Power BI package specifies reproducible visuals and measures.

Most important findings

8,000 MQLs produced 842 closed deals (10.53% conversion).

376 converted sellers had delivered orders purchased after closing (44.66% activation).

Attributed item GMV was BRL 664,858.00; this is marketplace merchandise value, not Olist net revenue.

Top 38 active sellers (ceiling of 10%) contributed 64.82% of attributed GMV.

295 sellers generated at least two post-close delivered orders.

Business impact

The analysis identifies where to investigate and test operational or commercial changes. Financial savings and causal impact are not estimated without intervention costs and experimental evidence.

Recommendations

Use observed GMV per lead together with activation to shortlist channel experiments; acquire spend data before claiming ROI.

Prioritize onboarding for converted sellers without post-close delivered orders. Separate recent wins from fully observed cohorts.

Inspect the largest seller accounts individually because concentration makes channel results sensitive to a few merchants.

Obtain assignment histories for lost leads before measuring SDR or sales-representative conversion rates.

Measurement limitations

Marketplace GMV is item price, not Olist commission revenue. Freight and platform take rate are excluded.

SDR, sales representative, business segment and lead type exist only on won deals. Their conversion rates cannot be computed without assignments for lost leads.

Activation is the first observed post-close delivered order; active seller and first-order stages cannot be separately identified.

Recent acquisitions have shorter observation windows. No causal channel comparison, channel ROI, CAC or long-term LTV is claimed.
